CI- FUNCTION: B3 ubiquitin ligase proteins mediate ubiquitination and subsequent proteasomal degradation of target proteins. Has a role during synaptogenesis negative regulator of synaptic growth.

CI- PATHWAY: Ubiquitin conjugation; third step.
CI- PATHWAY: Ubiquitin conjugation; third step.
CI- STRUELLUAR LOCATION: Nucleus (By similarity).
CI- STRUELLUAR LOCATION: Nucleus (By similarity).
CI- STRUELSE SPECIFICITY: Nervous system specific expression outside the caround which the synaptic neuropil forms. Expression outside the CNS starts at stage 16 in presynaptic terminals at the periactive exuberantly and are expanded in both the number of boutons and in the extent and length of branches.
CI- SIMILARITY: Contains 1 Rildanin repeat.
CI- SIMILARITY: Contains 1 Rildanin repeat.
CI- CAUTION: Ref.2 sequence differs from that shown due to erroneous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R GO; GO:0016023 C:Cytoplasmic membrane-bound vesicle; IDA.

"Expression of Sox3 throughout the developing central nervous system is dependent on the combined action of discrete, evolutionarily conserved, regulatory elements.; submitted (OCT-2001) to the EMBL/GenBank/DDBJ databases.
-!- SUBCELLULAR LOCATION: Nucleus.
-!- TISSUE SPECIFICITY: Mainly in the developing central nervous system. Expressed in developing urogenital ridge.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                      US DOE Joint Genome Institute (JGI-PGF);

The present invention describes an isolated WHC class II compound (I) comprising: (a) an MHC class II component comprising at least a portion of an MHC class II alpha chain and at least a portion of an MHC class II beta of an MHC class II alpha chain and MHC class II beta chain, such that the MHC class II alpha chain and MHC class II beta chain form a peptide binding groove; (b) a spaceholder molecule; and (c) an effector component, MHS described; (l) a pharmaceutical composition comprising the MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying an antigen-specific T cell; (4) a method of tregulating an immune disorder in a subject; (i) a method of regulating an immune disorder in a subject; (i) a method of treating an immune disorder ex vivo in a subject; and (7) a method of treating an immune disorder ex vivo in a subject; and (7) a method of treating an immune disorder ex vivo in a subject; and continuation in gene therapy. The MHC class II compound (I) can be used for preparing a composition for treating immune continuence represents a spaceholder molecule peptide, which can be used in the present invention.

Sequence represents a spaceholder molecule peptide, which can be used in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MHC class II compound; MHC class II component; MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component; immune response; immune disorder; virucide; antibacterial; antiparastitic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parastitic infection;

The invention relates to a new isolated lung specific nucleic acid

C molecule (I) comprising any of 113 fully defined nucleotide sequences

c given in the specification, their encoded protein sequences, sequences

c selectively hybridizing to the nucleotide sequences or a sequence having

at least 60% identity to the nucleotide sequences. The methods and

c compositions of the present invention are useful for identifying,

c diagnosing, monitoring, staging, imaging and treating lung cancer and non-

c annex monitoring and identifying and/or designing entagonists of the

c polypeptide of the invention, gene therapy, production of transgenic

c polypeptide of the invention, gene therapy, production of transgenic

c polypeptide of the invention of engineered lung tissue for treatment and

c research. Lung specific genes (LSGS) were identified by a systematic

c research. Lung specific genes (LSGS) were identified by a systematic

c analysis of gene expression data in the LIFESEQ Gold database using the

data mining software package candidate lead automatic search program

(CLASP). Genes were grouped into gene bins where each bin is a cluster of

sequences grouped together where they share a common contig.

C percentage level in the targeted tissue versus all the other tissues. The

c percentage level in the targeted tissue versus all the other tissues. The

c tumour tissues from cancer patients were compared with the expression

c percentage level in the invention of the invention

c levels in tissue libraries associated with tumour or disease. This

the

polypeptide that can be used in the recombinant DNA construct of

```
The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, hear, drought, herbicides, extreme commotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, ingnin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake curess condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the sequence. The sequence then 1200c1D:2004034888. The polymucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, around, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan,

WPI; 2004-119264/12.

New human genome-derived single exon nucleic acid probes useful for hume gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

Claim 45; SEQ ID NO 32001; 80pp; English.

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human gene expression (comprising a plurality of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of measuring human gene expression, a method of 

probe cited above, an ORF-encoded peptide comprising at least 8
contiguous amino acids of any of the above- mentioned amino acid
sequences (optionally with conservative amino acid substitutions), an
isolated antibody that binds specifically to a peptide cited above.

C methods of selling and/or licensing single exon probes or microarrays to
a customer desiring to measure gene expression, a method of providing
the many gene expression data by subscription, and a computer-readable
c storage medium which contains a database having a plurality of records
c teach record including data on the expression of a single exon probe
c cited above. The probe, methods and apparatus are useful in gene
c expression analysis. The probes may be used as tools for surveying
c tissues to detect the presence of expressed messages that contain their
c specific exon, or in constructing genome-derived single exon microarrays.

C naddition, the probes are used in identifying and characterising
c alternative splicing events, in detecting and characterising
c alternative splicing events, in detecting and characterising
c alternative splicing events, in priming the synthesis of nucleic a human
c smaller genomic alterations, in priming the synthesis of nucleic a human
c single exon probe protein of the invention. Note: The sequence data for
this patent did not form part of the printed specification, but was
c possible and proper processed the printed specification, but was ö Gaps .. 0 Score 49; DB 8; Length 109; Pred. No. 6.3; 1; Mismatches 0; Indels segdata.uspto.gov/sequence.html?DocID=20030194704 92.5%; 92.3%; Conservative Local Similarity nes 12; Conserv Sequence 109 AA; Query Match **datches**

WPI; 2001-639362/73 N-PSDB; AAS79688 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity

Claim 20; SEQ ID NO 45860; 103pp; English.

The invention relates to isolated polynuclectide (I) and polypeptide (II)

```
in diagnostics as expressed sequence tags for identifying expressed genes. (1) is useful in gene therapy techniques to restore normal cativity of (II) or to tread disease states involving (II). (II) is useful in gene therapy techniques to restore normal suctivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forenise, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at
sequences. (I) is useful as hybridisation probes, polymerase causer reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ftp.wipo.int/pub/published_pct_sequences

WPI; 2003-140616/13. N-PSDB; AAL51692 Expressing spider silk protein in a higher plant, by contacting a plant cell with silk protein encoding a gene linked to a gene that confers resistance to selection agent, and selecting cells that survive when incubated with the agent.

Claim 52; Fig 11; 114pp; English.

The invention comprises a method for expressing spider silk in a higher plant (e.g. arabidopsis, tobacco, tubers, sunflower, canola, alfalfa, soybean, maize, sorghum, wheat, cotton, small grains and rice). The method is useful for expressing spider silk in a higher plant. The silk

ö produced is useful in the production of fabrics, sutures, medical coverings, high-tech clothing, rope, reinforced plastics, and other applications in which various combinations of strength and elasticity are required. The present amino acid sequence represents a spider silk-related protein The invention relates to novel spider silk proteins e.g. major ampullate spidroin 1-like (MaSp1) spider silk protein, major ampullate spidroin 2-like (MaSp2) spider silk protein; (Flagelliform (Flag)-like spider silk proteins comprising atypical repetitive motifs. proteins and spider silk proteins comprising atypical repetitive motifs. Sequences of the invention are useful for producing fabrics, sutures, medical coverings, high-tech clothing, rope and reinforced plastics. They are used to make high-tech clothing, rope, salls, parachutes, wings on aerial devices (e.g. hand gliders), flexible tie downs for electrical components, sutures and as biomaterials for implantation (e.g. artificial ligaments or acrtic banding). Blomedical applications of the spider silk fibers in Spider silk protein; flagelliform-like spider silk protein; FLAG; MaSp; major ampullate spidroin; fabric; medical covering; clothing; parachute; rope; reinforced plastic; suture; aerial device wing; sail; hand glider; implantation biomaterial; resin product; fiber-reinforced plastic; thermal injected plastic; fibroin 1. sutures used in surgical procedures, including eye surgery, vascular closure, bowel surgery, cosmetic surgery, reconstructive surgery (e.g. nerve or tympanic membrane reconstruction) and central nervous system surgery. Natural and synthetic spider silk fibers are also used in the generation of antibiotic impregnated sutures and implant material and matrix material for reconstruction of bone and connective tissue. Spider Gaps Novel spider silk protein e.g. major ampullate spidroin 2-like, flagelliform (Plag)-like spider silk proteins, useful for producing fabric, sutures, medical coverings, high-tech clothing, rope. ö Length 252; 0; Indels 9 Motriuk D; DB 14; 1; Mismatches Score 49; Pred. fibroin and different spider silk proteins. Synthetic spider silk fibers may be mixed with various plastics and/or resins to prepare a fiber reinforced plastic and/or resin product. They are useful as structural reinforcement material in thermal injected plastics. The present sequence is Zorocrates species fibroin 1 protein. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1.8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of the control of the control of the control of cacivity of (II) is useful in gene therapy techniques to restore normal consectul for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a colypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and (II) and its binding partners are useful in medical imaging of supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this camino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGITS-ABLIGITS), and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (ADO61534-ADO63778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild type plant. The transgenic plant comprises increased tolerance to osmotic stress, increased tolerance to objotic stress, increased tolerance to cold, increased tolerance to cold, increased tolerance to heat, increased germination in cold, increased tolerance to heat, increased germination in heat, increased tolerance to freezing conditions, increased tolerance to low nitrogen conditions, increased tolerance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Reuber TL;

                                                                                                                              The present invention relates to methods for identifying genes and proteins that are implicated in a specific disease or physiological condition. The method comparing the transcriptome/proteome of a specialised cell type implicated in a disease or condition with that of second specialised cell type, under two experimental conditions, and identifying a gene that is differentially regulated in the two specialised cell types under experimental conditions, and specialised cell types under experimental conditions ABN77873-ABN7816 and ABP65061-ABP65257 were identified using the methods of the invention. The coding sequences and proteins are useful for treating a disease in a patient, for manufacture of a medicament for treating hypoxia-regulated conditions, and for regulating tumourigenesis, anglogenesis, apoptosis, biological response to hypoxia conditions, or hypoxic-associated
                                                                                                                                                                                                                                                                                                                  pathology in a patient. The coding sequences and proteins are also useful for monitoring the therapeutic treatment of a disease or physiological condition, such as cancer, ischaemic conditions, repertuasion injury, retinopathy, neonatal stress, preeclapmesia, atherosclerosis, inflammatory conditions, wound healing, inflammation, erythropoiesis or hair loss
                            Identifying a gene involved in disease for treating hypoxia-regulated conditions, comprises comparing the transcriptome/protecome of two cell types under different conditions and identifying a differentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to novel human secreted proteins (SECP) and polynucleotides encoding such proteins. SECP sequences are useful for diagnosing, treating and preventing cell proliferative disorders including cancer (e.g. arteriosclerosis, cirrhosis, hepatitis, psoriasis and atherosclerosis), developmental disorders (e.g. seizure disorders, cand tubular acidosis, anaemia, cataract and sensorineural hearing consist, neurological disorders (e.g. epilepsy, ischaemic cerebrovascular disease, Alzheimer's disorders, pick's disease, Huntington's disease, Strizophrenic disorders, mental disorders including mood and anxiety, crowette's disorders mential disorders including mood and anxiety, disorders (e.g. acquired immunodeficiency syndrome (AIDS), allergy, adult crespiratory distress syndrome (ARDS), autoimmune thyroiditis, disorders mellitus, Crohn's disease, glomerulonephritis, rheumatoid arthritis, atopic dermatitis, ulcerative collits, trauma and viral, bacterial, fungal, parasitic, protozoal and helminthic infections) and cardisease, angina pectoris, myocardial infarction, hypertensive heart cisease, congenital heart disease and myocarditis). They are useful for creating knocking humanised animals or transgenic animals to model human cliseases. Sequences of the invention are useful in somatic or germiline gene therapy and in diagnostic purposes. They are also used as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel human secreted proteins and genes encoding the proteins, useful for treating, diagnosing and preventing cell proliferative, autoimmune/inflammatory, cardiovascular, developmental or neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Yue H, Lee EA, Becha SD, Baughn MR, Yao MG, Tang YT;

The invention discloses a polymuclectide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel comparities to the polymetides. Also claimed is a polymetide encoded by the polymetide or it partial peptide, an antibody binding to the polymetide or peptide or the polymetide of the polymetide of the polymetide or peptide or peptide or peptide of the polymetide or peptide or proteins are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and many disease-related proteins of their expression and activity or as targets of generation. Membrane proteins, disease-related proteins, disease-related proteins and genes or proteins to medicine for each as indicators for diseases (e.g. osteoproreis, encoding them can be used as indicators for diseases (e.g. osteoproreis, concert, the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ìв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                  Gaps
sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specification. The primers are useful for synthesising polynucleotides, gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH03628 and AAH15631 to AAH18642 represent human amino acid sequences; and AAH15629 to AAH03632 represent oligonucleotides, all of which are used in the exemplification of the
The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide comprises at least 15 nucleotides and the combination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB97737). ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Drosophila melanogaster daughter of legless (Doll) protein SEQ ID NO:6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

The present invention describes a nucleic acid sequence and its encoded colypeptide, which are part of at least one signalling pathway in insects and vertebrates. The nucleic acid sequence is the daughter of legless cand vertebrates. The nucleic acid sequence is the daughter of legless (doll) gene, as well as its homologues, fragments, derivatives, or functional or structural analogues. The polypeptide is the daughter of edrivatives, or functional or structural analogues. Doll sequences have cycostatic activity, and can be used in gene therapy. The doll nucleic cycostatic activity, and can be used in gene therapy. The doll nucleic acid, Doll protein, or their homologues, derivatives or fragments can be used for developing a therapeutic and diagnostic compound (e.g. antibodies or its fragments, doll antisense DNA or RNA, doll double stranded RNA, or chemical or naturally occurring compounds interfering with doll function) for the treatment or diagnosis of disorders of call face, differentiation or proliferation. Fragments of the doll DNA sequences is useful as a hybridisation probe. The disorders which can be treated using doll sequences includes human tumours, (pre-) neophastic, condition-) malignant or cancerous conditions. The present sequence represents
Nucleic acid sequences of the Drosophila melanogaster Daughter of Legless gene and its encoded polypeptide, useful for developing therapeutic or diagnostic compound for treating or diagnosing e.g. tumors or cancerous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   developmental biology; cell signalling; insecticide;

a POSH (plenty
                                                                                      The present invention relates to a method of identifying an antiproliferative agent, comprising providing a POSH (plenty of SH3 domains) polypeptide and a test agent, and identifying the test agent that interacts with the POSH polypeptide. The POSH protein is a ubiquitin ligase enzyme. The method is useful for identifying agents for treating a neoplastic condition, preferably cancer selected from thyroid carcinoma, liver cancer (hepatocellular cancer), lung cancer, cervical cancer, ovarian cancer, renal cell carcinoma, lymphoma, osteosacoma, liposarcoma, leukaemia, breast carcinoma and breast adenocarcinoma. The present sequence is a protein sequence shown in the exemplification of the
 neoplasia,

cell proliferation, enzyme; cytostatic, cancer.
                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

invention involves producing a recombinant POSH polypeptide. Also disclosed is a method for identifying an antiviral or antiapoptotic agent, comprising providing a POSH polypeptide and a test agent, and identifying a test agent that interacts with the POSH polypeptide. The POSH polypeptide comprises an SH3 or RING domain, where the test agent binds. The test agent is a polypeptide, an antibody, a small molecule or a peptidomimetic. The test agent that interacts with POSH decreases the maturation of a virus containing the PTAP or PPEY motif. The interaction with POSH and day polypeptide. Alternatively, identifying an antiviral agent comprises providing a POSH nucleic acid and a test agent, and identifying a test agent that binds to the POSH nucleic acid. The test agent, and identifying a test agent that binds to the POSH nucleic acid. The test agent is a contained a test agent is a contained acid, an antisense oligomuclectide, a RNAi construct, a DNA enzyme or a ribozyme. The nucleic acids, polypeptides, compositions and methods of the invention are useful for treating viral disorders, and and a test agent is a contained with a construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disorders caused by envelop viruses, retroid viruses and RNA luding retroviruses, rhabdoviruses, lentiviruses and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    filoviruses. The current sequence represents the mouse POSH protein

Disclosure; SEQ ID NO 9; 163pp; English

The present sequence is the protein sequence of murine Plenty Of SH3 domains (POSH). The invention provides novel complexes of POSH

polypeptides and POSH associated kinases (POSH-AKB). An isolated, countied or recombinant complex comprising a POSH polypeptide and a POSH-AK but it is claimed. The complex is used in methods for identifying agents that modulate an activity of POSH or POSH-AK by disrupting a complex of POSH and POSH-AK. These modulator agents can be used as antivital agents, especially where the virus is an envelope virus, HIV or West Nile virus, or as anti-apoptotic or anti-cancer agents in which a modulator agent will decrease the proliferation or survival of a POSH-associated cancer cell. The modulator agents may also inhibit crafficking of a protein through the seretory pathway. An inhibitor of POSH, e.g. an agent that inhibits a POSH-AP, or an agent that inhibits or posh expression, can be used to inhibit the Jun kinase (JNK) pathway in a human cell and hence to treat a JNK pathway-associated disease. A POSH inhibitor may also be used to treat a protein kinase (JNK) pathway in a cell and hence to treat a protein kinase (JNK) pathway in a second protein in a cell comprises contacting the cell with an agent that inhibits phosphorylated POSH polypeptide is claimed, which is phosphorylated POSH polypeptide is claimed, which is phosphorylated POSH polypeptide is claimed, which is a sportion of a POSH polypeptide including a consensus PKA phosphorylation site, at a site of sequence K/R-R-X-S/T-hydrophobic or R-X-X-S/T-hydrophobic. Also claimed is a postion mammalian POSH polypeptide including a consensus PKA phosphorylation of POSH. ô cytostatic; nootropic; neuroprotective; antiparkinsonian; anticonvulsant; antiviral; neuroleptic; central nervous system; POSH polypeptide; POSH-associated protein; POSH-AP; HERPUDI; Ubiquitin ligase; antiviral agent; anti-apoptotic agent; anti-cancer agent; neurological disorder propression disorder; Alzheimer's disease; Parkinson's disease; Huntington's disease; schizophrenia; Gaps .; 0 Score 49; DB 8; Length 892; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated, purified or recombinant complex (I) comprising a PoSH polypeptide and a PoSH-associated protein (POSH-AP) (a) or HERPUDI and a Ubiquitin ligase (b). Methods using (I), (a) or (b) are useful for identifying an agent that modulates an activity of a POSH polypeptide or POSH-AP, for identifying an antiviral agent, an anti-apoptotic agent, an anti-cancer agent, an agent that inhibits trafficking of a protein through the secretory pathway, an agent that inhibits the progression of a neurological disorder, an agent that modulates a POSH function, an agent that modulates a HERPUDI function. The methods can be used for treating a viral infection, for inhibiting an activity of a POSH-associated disease is viral infection, POSH-associated cancer or POSH-associated disease is viral infection, POSH-associated cancer or POSH-associated neurological disorder. The methods are useful for treating or preventing POSH-associated neurological disorder. The methods are useful for treating or preventing POSH-associated neurological disorder in a subject e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, schizophrenia, Niemann-Pick's disease. This sequence corresponds to a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                 Isolated, purified or recombinant complex, useful for identifying an antiviral, anti-apoptotic or anti-cancer, comprising POSH polypeptide and POSH-associated protein (POSH-AP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse; POSH; plenty of SH3 domains; ubiquitin ligase; enzyme; neuroprotective; nootropic; antiparkinsonian; anticonvulsant; cerebroprotective; CNS-gen.; antidepressant; neuroleptic; gene therapy.

The present sequence is the protein sequence of murine POSH (plenty of SH3 domains), a ubiquitin ligase. The invention relates to POSH and to the discoverty of novel interactions between POSH and POSH and to the discoverty of novel interactions between POSH and POSH associated proteins, especially HERPUDI. Methods are provided for modulating a process in which POSH participates by targeting HERPUDI or the participates by targeting HERPUDI or the participates by targeting a process in which HERPUDI participates by targeting POSH. A claimed method of treating a neurological disorder comprises administering an agent that inhibits a ubiquitination. The neurological disorder is selected from: Alzheimer's disease, Parkinson's disease, Huntington's disease, Pick's disease, Niemann-Pick's disease, Huntington's disease, depression and schizophrenia. The modulator agent is a short interfering RNA (siRNA) construct, a small molecule, an antibody or an antisense construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New complex of POSH polypeptides and POSH-associated protein (POSH-AP) useful for identifying an agent for treating neurological disorder e.g. Alzheimer's disease, Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present sequence is the protein sequence of mouse POSH. The invention relates to novel associations between Cbl-b and POSH. Cbl-b and POSH are involved in viral maturation, including the production, post-translational processing, assembly and/or release of proteins in a viral particle. Viral infections may be ameliorated by inhibiting an activity (e.g. ubiquitin ligase activity or target protein interaction) of POSH or Cbl-b. The virus is a retroid virus, an RNA virus or an envelope virus, capecially a human immunodeficiency virus. A claimed method of identifying an antiviral agent comprises identifying a test agent that disrupts a complex of a Cbl-b polypeptide and a POSH polypeptide. A claimed method of treating a viral infection comprises administering an agent that inhibits the expression or activity of Cbl-b. The agent is preferably an siRNA construct ADU73816 that inhibits expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of human Cb1-b, an antisense construct, and the cora and antised or a small molecule. Also claimed are: methods of identifying and evaluating agents that modulate a Cb1-b or POSH function by measuring the effect of the agent on Cb1-b-mediated or POSH-mediated builduination or on budding, release, infectivity or reverse transcriptase activity of a virus or virus-like particle; methods of identifying an anti-apoptotic agent, an anti-cancer agent or an agent that inhibits progression of a neurological disorder, where the agent disrupts a complex comprising Cb1-b and POSH (or a CB1-b-associated protein such as POSH-associated neurological disorder or POSH-associated viral disorder using an agent that inhibits the expression or an activity of a CB1-b-bolypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein secretion; protein localization; golgi apparatus; plenty of SH3 domains protein; POSH; neuroprotective; nootropic; antidiabetic; antiinflammatory, virucide; antibacterial; antiparasitic; immunosuppressive; antiparatinsonian; anticonvulsant; neuroleptic; cytostatic; CNS-Gen.; cardiovascular disease, viral infection; bacterial infection; bacterial infection; microbial protein; neurological disease; immune disorder; Alzheimers disease; parkinsons disease;
                                                                                                                                                                                                                                                                   polypeptide, a POSH polypeptide, useful for treating Cbl-associated diseases, e.g. cancer, viral infection, disorders of the immune system,

The invention relates to a novel method for modulating the activity or localization of a trans-Golgi network (TGN) -associated protein. The method involves modulating the activity of one or more TGN-associated or proteins chosen from plenty of SH3 domains protein (POSH), a POSH-pathway CC proteins chosen from plenty of SH3 domains protein (POSH), a POSH-pathway cp polypeptide, a POSH-pathway polypeptide, a posH-associated polypeptide or a POSH binding protein. The method of the invention demonstrates neuroprotective, nootrople; cm antidabetic, antiinflammatory, virucide, antibacterial, antiparsitic, immunosuppressive, antiparkinsonian, anticonvulsant, neuroleptic, cytostatic and CNS-Gen applications. The method of the invention may be cytostatic and CNS-Gen applications. The method of the invention may be cytostatic for modulating the activity or localization of a TGN-associated protein, in particular, the method may be useful in inhibiting processing of a protein associated with a neurological disorder, cardiovascular disease or immunological disorder, in the subject, where the subject exhibits a neurological disorder chosen from Alzheimer's cardiovascular disease and prion-associated disease, preferably continumuno pick's disease and prion-associated disease, preferably continumuno disorder chosen from an inflammatory disease or an inflammatory disease or an inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          autoimmune disease, such as diabetes or a disease associated with improper glycosylation, where the improper glycosylation is N-linked glycosylation. Furthermore, the method may be useful for inhibiting the processing of a protein such as a myristylated protein, and for inhibiting the processing of a protein that is associated with a neoplastic condition, in a subject having cancer. The cancer is chosen from thyroid carcinoma, liver cancer, hepatocellular cancer, lung cancer, cervical cancer, colorectal cancer, ovarian cancer, renal cell carcinoma, lymphoma, osteosarcoma, prostate cancer, in posarcoma, prostate cancer, in posarcoma, prostate cancer, in the cancer of the cancer of

New small molecule inhibitor of a POSH polypeptide useful e.g. to inhibit ubiquitin ligase activity of polypeptide, to treat viral infections, neurological disorder e.g. Alzheimer's disease, and to treat or prevent

This invention describes a novel small molecule inhibitor of a POSH polypeptide chosen from human Cbl-b polypeptide, a human PEM-3-like polypeptide, a SIAH1 polypeptide or a TTC3 polypeptide, comprising a RING domain. The POSH polypeptide is ARIH2, ASFIB, ATP5A1, BANF1, BAT3, BCAR1, BCL9, BIAA, BRA9, CLK2, COLIA1, DAP, DDX31, DKFZp434B1211, DKFZp761A052, DLG5, DNM2, DRP2, ERFHA1, EGLN2, EIFFERPPL, EWSR1, FAF1, EG1-27, CIC, CL25084, CLM25084, CLM2, SPF1A1, EGLN3, EIFFERPPL, EWSR1, FAF1, FE3557, FLJ1321, FLJ13479, FUJ7147, FST11, GC20, GLUL, HEBP2, CLJ13155, Hs.380933, HSPAIB, HSPC016, HSPC142, ITGB, J03930, KHDRBS1, CRAA1011, KIAAA111, KIAAA199, FUJ7147, FST11, GC20, GLUL, HEBP2, CLM31315, HSPAIB, HSPC016, HSPC142, ITGB, J03930, KHDRBS1, CRAA1111, KIAAA199, FUJ7147, FST11, GC20, GLUL, HEBP2, CCNT2, PGD, PIASY, POLQ, POLR212, RPMX5, PROL4, RAPB0, RBAF600, RNH, RPL, CCNT2, PGD, PIASY, POLQ, POLR212, SRPX5, RST41, SRPX1, SRT51, FRYS1, SRY3, ST711, TPC2, UBB21, HSPS1, SRY3, ST711, TPC2, UBB21, HSPS1, SPR11, SNX1, SN 

ö transport of amyloid precursor protein (APP) in a cell or cell proliferation or amyloid polypeptide production in a cell and also for the treatment of a viral infection (an envelope, a retroviral or a human immunodeficiency viral infections) or neurological disorder (Alzheimer's disease, Parkinson's disease, Huntington's disease, pick's disease, depression or schizophrenia). The inhibitor is also useful in the treatment and prevention of cancer, in a method of inhibiting ubiquitin ligase activity of a polypeptide, for maturation of a virus in a cell, for transport of APP and is capable of targeting one or more proteins. The products of the invention have cytostatic, virucide, anti-HIV, cerebroprotective, nootropic, anticonvulsant, antiparkinsonian, cerebroprotective, antidepressant and neuroleptic activity. This sequence represents a mouse POSH protein. Gaps ö 9; Length 892; 0; Indels Score 49; DB 9 Pred. Mouse POSH

(PROT-) PROTEOLOGICS INC. Reiss Y;

WPI; 2005-322863/33. N-PSDB; ADZ66428

Isolated, purified or recombinant complex useful for identifying antiviral agent and anti-apoptotic agent, comprises plenty of SH3 domains POSH polypeptide and POSH-associated proteins POSH-AP.

Disclosure; SEQ ID NO 9; 171pp; English

This sequence represents a mouse ubiquitin (Ub) ligase, plenty of SH3 domains (POSH). The composition of the invention comprises a human POSH polypeptide and a POSH-associated protein (POSH-AP), or a polypeptide comprising a domain that is 90% identical to a POSH SH3 domain and a POSH -AP comprising an E2. Interactions between POSH and POSH-AP may be involved in many cellular processes, including viral maturation, regulating Nac or JNK signaling pathway, etc. An antibody which is immunoreactive with the epitope of human POSH amino acid sequence, where the antibody disrupts the interaction between a POSH polypeptide and a POSH-AP may be used for inhibiting viral infection. The POSH-AP comprises

The invention relates to a novel method for identifying a protein substrate for an E3 protein comprising expression of an E3 protein, a coubstrate for an E3 protein and a prey fusion protein in a cell, where the E3 protein mediates covalent attachment of the bait protein to a prey protein that is a protein substrate of the E3 protein. The physical protein; the proteins induces an output signal which is detected. The ubiquitin-mediated proteolysis system is the major pathway for the selective, controlled degradation of intracellular proteins in eukaryotic calls. The process of degradation is catalyzed by a ubiquitin-activating enzyme (E1) and a ubiquitin-conjugating enzyme (E2), but may also require auxiliary substrate recognition proteins (E3s). The method of the invention may be useful for identifying a protein substrate for an E3 protein, which is subsequently useful for mediating ligation of ubiquitin or ubiquitin-like proteins. The current sequence is that of the murine post (plenty of SH3 domains) protein of the invention.
                                                                                                                                                                                           ö
BE2, which is chosen from UBC13, UBC5a, UBC5c and UBC6. The UBC13 is in a heterodimeric complex with a Ub conjugating enzyme variant (UBV) protein eg. UBV1a. The composition of the invention is useful for identifying an anti-viral agent and an anti-apoptotic agent, which involves identifying a test agent that disrupts the compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying a protein substrate for an E3 protein, useful to allow modulation of ubiquitination, comprises expression of an E3 protein, a bait fusion protein, and a prey protein in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein degradation; protein interaction; POSH; plenty of SH3 domains.

The invention relates to a method for identifying an agent that modulates an activity of a HERPUDI polypeptide. The method comprises identifying an agent that modulates a complex comprising a HERPUDI polypeptide and a Nef polypeptide and a Nef polypeptide is an agent that modulates an activity of the HERPUDI polypeptide. Also described: (1) a method of inhibiting a MERPUDI polypeptide and a Cell infected with HIV; (2) a method of inhibiting a confinite in a subject infected with HIV; (3) an isolated, purified, or recombinant complex comprising a HERPUDI polypeptide and a Nef polypeptide; (4) a method of inhibiting an entity of a method of inhibiting a viral infection in a subject; (7) a HERPUDI colypeptide; and (8) a Nef polypeptide. The methods are useful for inhibiting a nagent that modulates an activity of a HERPUDI polypeptide, and (8) a Nef polypeptide. The methods are useful for inhibiting a Nef-mediated process in a cell infected with HIV, and inhibiting the progression of AIDS in a subject infected with HIV. The present sequence represents mouse POSH, which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying agent that modulates activity of HERPUDI polypeptide, by identifying agent that modulates a complex comprising HERPUDI and Nef polypeptide, where agent that modulates the complex modulates activity of HERPUDI polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                    viral maturation inhibition; viral replication; viral infection; antiviral; anti-HIV; POSH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 49; DB 9; Length 892;

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving oxpressed cativity of (II) or to treat disease states involving or quantitating a polypeptide in tissue, as molecular weight markers and as a food polypeptide in tissue, as molecular weight markers and as a food involving aberrant protein expression or biological activity. The involving aberrant protein expression or biological activity. The colypeptide and polymucleotide sequences have applications in a diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed continuate protuction of (II). The polynucleotides are also used continuate to treat disease states involving aspressed activity of (II) or to treat disease states involving or quantitating a useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                     New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eutaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly
                  isolated nucleic acid detection reagent for detecting 1000 or more as from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Funke RP;

The present invention relates to a method for identifying candidate p53 pathway modulating agents. The method involves contacting an assay system comprising purified chromatin organisation modifier (chromo) domain helicase DNA binding proteins (CHD), nucleic acids, their functionally active fragments or derivatives, with a test agent under conditions where, but for the presence of the test agent, the system provides a reference activity. The methods are useful for identifying modulators of the p53 pathway as therapeutic targets for disorders associated with defective p53 function, such as angiogenic disorders, apoptotic disorders or call proliferative disorders, e.g. cancer. The modulators are useful as research reagents, diagnostics and therapeutics. The invention is also useful in gene therapy. The present sequence is human chromodomain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antiinflammatory, Antiarteriosclerotic, Antipsoriatic; Gynaecological; Vasotropic; Vulnerary; Hypotensive; Antianginal; Cardiant; Osteopathic; gene therapy; antiangiogenic; tumour vascularisation; retinopathy; rheumatoid arthritis; Crohn disease; atherosclerosis; ovarian hyperstimulation; psoriasis; endometriosis; neovascularization; restenosis; cardiovascular disease; hypertension; Raynaud disease; muscular degeneration; osteoporosis; human; CHD3.
Identifying a candidate p53 pathway-modulating agent as therapeutic targets for disorders related to defective p53 function e.g. cancer by contacting an assay system having purified CHD polypeptide or nucleic acid, with a test agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antiangiogenic composition, useful for treating e.g. tumors, comprises new angiogenesis-related nucleic acids or related polypeptides, antibodies or antisense sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Claim 5; SEQ ID NO 34; 110pp; French.

The present invention relates to antiangiogenic pharmaceutical compositions. The compositions comprise, as active ingredient, one or compositions. The compositions comprise, as active ingredient, one or more of: nucleac acid (1; ADIS6740-ADIS6730 encoded by (15. or instance) an endothelial cell gene the expression of which is induced by an antiopact, or its complement or fragment; polypeptide (11; ADIS6730 encoded by (1), or its fragment; can antisense nucleic acid (111; ADIS6750-ADIS6753) able to inhibit an antisense nucleic acid (111; ADIS6750-ADIS6753) able to inhibit care used for treating a wide range of angiogenic diseases: tumour vascularisation; retinopathy; rheumatoid arthritis; Crohn disease; carborosis; ovarian hyperstimulation; psoriasis; endometriosis atherosclerosis; ovarian hyperstimulation; psoriasis; endometriosis associated with neovascularization; restenosis (arterial or after balloon cargoplasty); overgrowth of cells in wound healing; peripheral vascular disease; hypertension; vascular inflammation; Raynaud disease; aneurysm; chrombophlebitis; lymphedema; ischaemia; angina; myocardial infarct; chrombophlebitis; lymphedema; ischaemia; angina; myocardial infarct; chrombophlebitis; lymphedema; ischaemia; angina; myocardial infarct; chrombophlebitis (composition) and osteoporosis. This sequence is chromodomain
